The hypothesis that life in the Universe depends upon certain physical constants having values within a narrow range and the belief that the observed values warrant an explanation. The characterization of the universe as finely tuned suggests that the occurrence of life in the Universe is very sensitive to the values of certain fundamental physical constants and that the observed values are, for some reason, improbable.

A Fine-Tuned Universe: The Quest for God in Science and Theology. In A Fine-Tuned Universe: The Quest for God in Science and Theology Alister McGrath seeks to recover a vision for natural theology that is 'both securely rooted in the long tradition of Christian theological reflection and adequately adapted to our understandings of the natural world'.

conditions essential for life to exist in the universe can occur only when certain universal physical constants and forces lie within a very narrow range of values. If any of them were to differ slightly, then our universe would be unlikely to be conducive to the establishment of life.

The universe is also fine tuned to the extent that there is just enough nucleons (protons and neutrons) to form the elements essential for life. After the "big bang", all of the galaxies and stars that make up the universe today were form from left over nucleons from this initial singularity.

Fine-tuning of the Universe | Evidence To Believe

One major issue in cosmology for years has been the apparent fine-tuning seen in our universe. The universe seems specially crafted to allow life. One of the major explanations for this comes from string theory, which is the anthropic principle. Many string theorists have recently begun adopting.

Fine-Tuning Really Is A Problem In Physics

Recent Studies have confirmed the fine tuning of the cosmological constant (also known as "dark energy"). This cosmological constant is a force that increases with the

increasing size of the universe. First hypothesized by Albert Einstein, the cosmological constant was rejected by him, because of lack of real world data.

The Universe: Evidence for Its Fine Tuning

One of the most remarkable scientific findings of the 20th century is the delicate fine-tuning of the laws that govern the universe, which enable the emergence and sustenance of intelligent life. Scientists have been struck by how precisely the laws of physics seem to be calibrated for life.

A Fine-Tuned Universe - Quest For Truth

Fine-tuning refers to the surprising precision of nature's physical constants and the early conditions of the universe. To explain how a habitable planet like Earth could even exist, these fundamental constants have to be set to just the right values (like tuning a dial to find just the right radio station).

A Fine-Tuned Universe by Alister E. McGrath

Strong evidence for a Designer comes from the fine-tuning of the universal constants and the solar system, e.g. The electromagnetic coupling constant binds electrons to protons in atoms. If it was smaller, fewer electrons could be held. If it was larger, electrons would be held too tightly to bond with other atoms.

Why a Fine-Tuned Universe? How can so many numbers of nature—the constants and relationships of physics—be so spot-on perfect for humans to exist? Coincidence and luck seem wildly unlikely. This question causes controversy, among scientists and among philosophers. Beware: there is more than one answer lurking here.
