MFMcGraw-PHY 2425 Chap 15Ha-Oscillations-Revised 10/13/2012 26 The period of oscillation of an object in an ideal mass-spring system is 0.50 sec and the amplitude is 5.0 cm. What is the speed at the equilibrium point? At equilibrium  $x = 0$ :  $2 \cdot 2 \cdot 2 \cdot 1 \cdot 2 \cdot 1 \cdot 2 \cdot 1 \cdot E = K + U = mv + kx = mv$  Since  $E = \text{constant}$ , at equilibrium ( $x = 0$ ) the KE must be a maximum.

### Chapter 15 Oscillations and Waves

Water waves are unusual because waves can have different speeds - wave speed depends on how the wave is formed, which is why tsunamis travel much faster than surf waves. Unlike water waves, electromagnetic waves always travel at the same speed (3 hundred million metres per second) and sound waves all travel at the same speed in a given medium (for example, approximately 340 metres per second ...

The sea waves close to the shore are another obvious example of such waves. In a more narrow sense waves mean periodic movement existing in the media, where at every point we have periodic oscillations in time, and the phase of these oscillations is periodic in space. Waves in water far from the shore in calm weather are a good example.
